Technical Data Sheet

Sulphate Resisting Portland Cement

Product Name:

Sulphate Resisting Cement - SRC

General use:

SRC is highly suitable for concrete structures

Standard:

EN 197-1:2011 (strength class 42.5N) SR-5.

subject to sulfates rich environment. This is

Precautions, health & safety.

Dry cement in normal use has no harmful effect on dry skin. When cement is mixed with water, alkali is released. Precautions should therefore be taken to avoid dry cement entering the eyes, mouth and nose and to prevent skin contact with wet cement. Repeated skin contact with wet cement over a period may cause irritant contact dermatitis. The abrasiveness of the particles of cement and aggregate in mortar or concrete can contribute to this effect. Continued contact during a working day can lead to cement burns with ulceration but this is not common. Some people are sensitive to the small amounts of chromate, which may be present in cements and can develop allergic contact dermatitis, but this is rare. Clothing contaminated with wet cement, mortar or concrete should be removed and washed before further use.

If cement enters the eye it should immediately be washed out thoroughly with clean water and medical treatment should be sought without delay. Wet mortar or concrete on the skin should be washed off immediately.

Cement quality & Strength:

QNCC produces high quality cement through a precise quality plan, resulting in high strength product.

More than 70% of 28-days strength required by standard (42.50 N/mm²) obtained at 7-days.
